

modern assistant of the urban homegardener

Our modern lifestyle has changed our relationship with nature in a lot of ways. Many people would like to have more living plants even in the middle of a busy urban environment, but the available conditions are often not the best for plants. The **IoT-pot** helps you to treat your plants in ways they can flourish. This handy assistant is always within reach, gives you live information of your plants' wellbeing and can even help you out to take care of them!

What is IoT-pot?

IoT-pot consists of two elements:

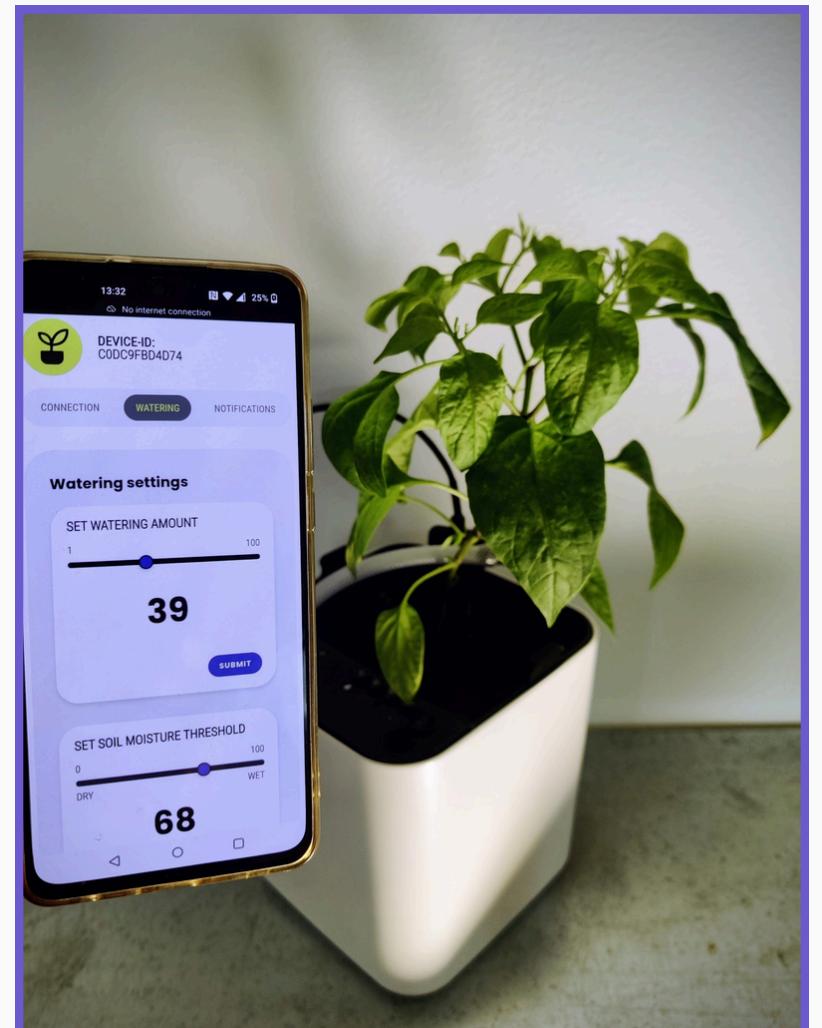

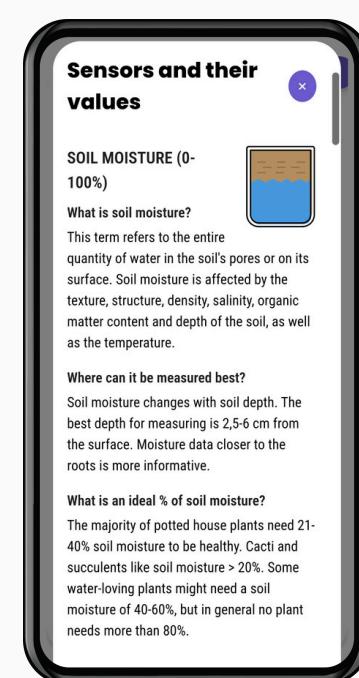

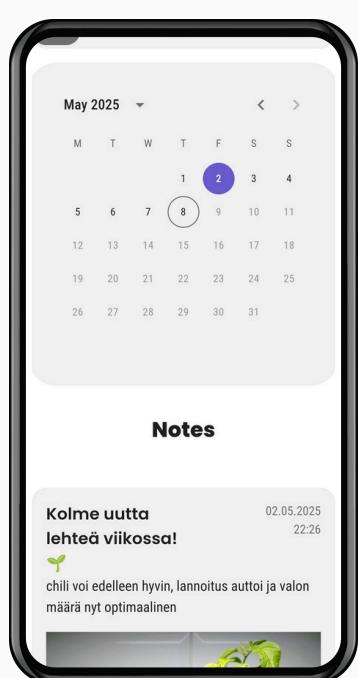

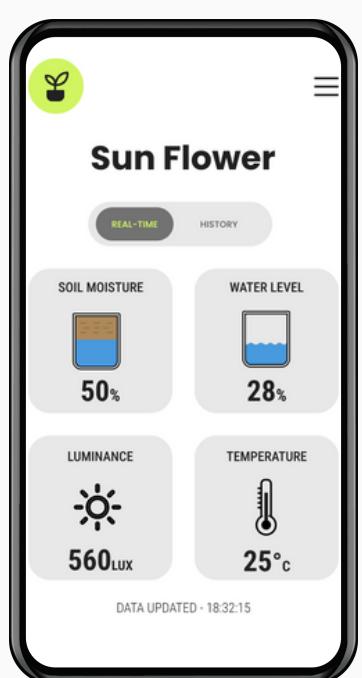

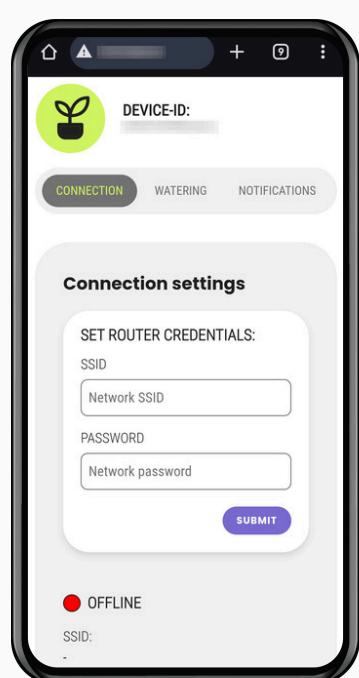

pot

An intelligent plant pot, which measures the life conditions of the plant and waters the plant automatically if needed

+

app

Shows you at one glance how your plant is doing and you can also keep a diary of your plant's wellbeing

The app is user friendly and intuitive. The measurements taken by the pot's sensors give you invaluable assistance in the busy day to day life, when you are not capable to check on your plants in person as much as you wanted to. The usage of IoT-pot doesn't require any special technical knowledge, it comes as a ready-to-use package with clear usage instructions.
